A schematic git workflow

Trunks and Branches

Trunk

Unnamed branch of a file tree under revision control

Structure

The structure of the revisions is not a tree (although it is often referred to as the revision tree) but a directed acyclic graph.

Tag

A tag assigns a label to a revision (including many files) allowing to directly jump to that revision. Often used to label a specific version of a software.

Branching

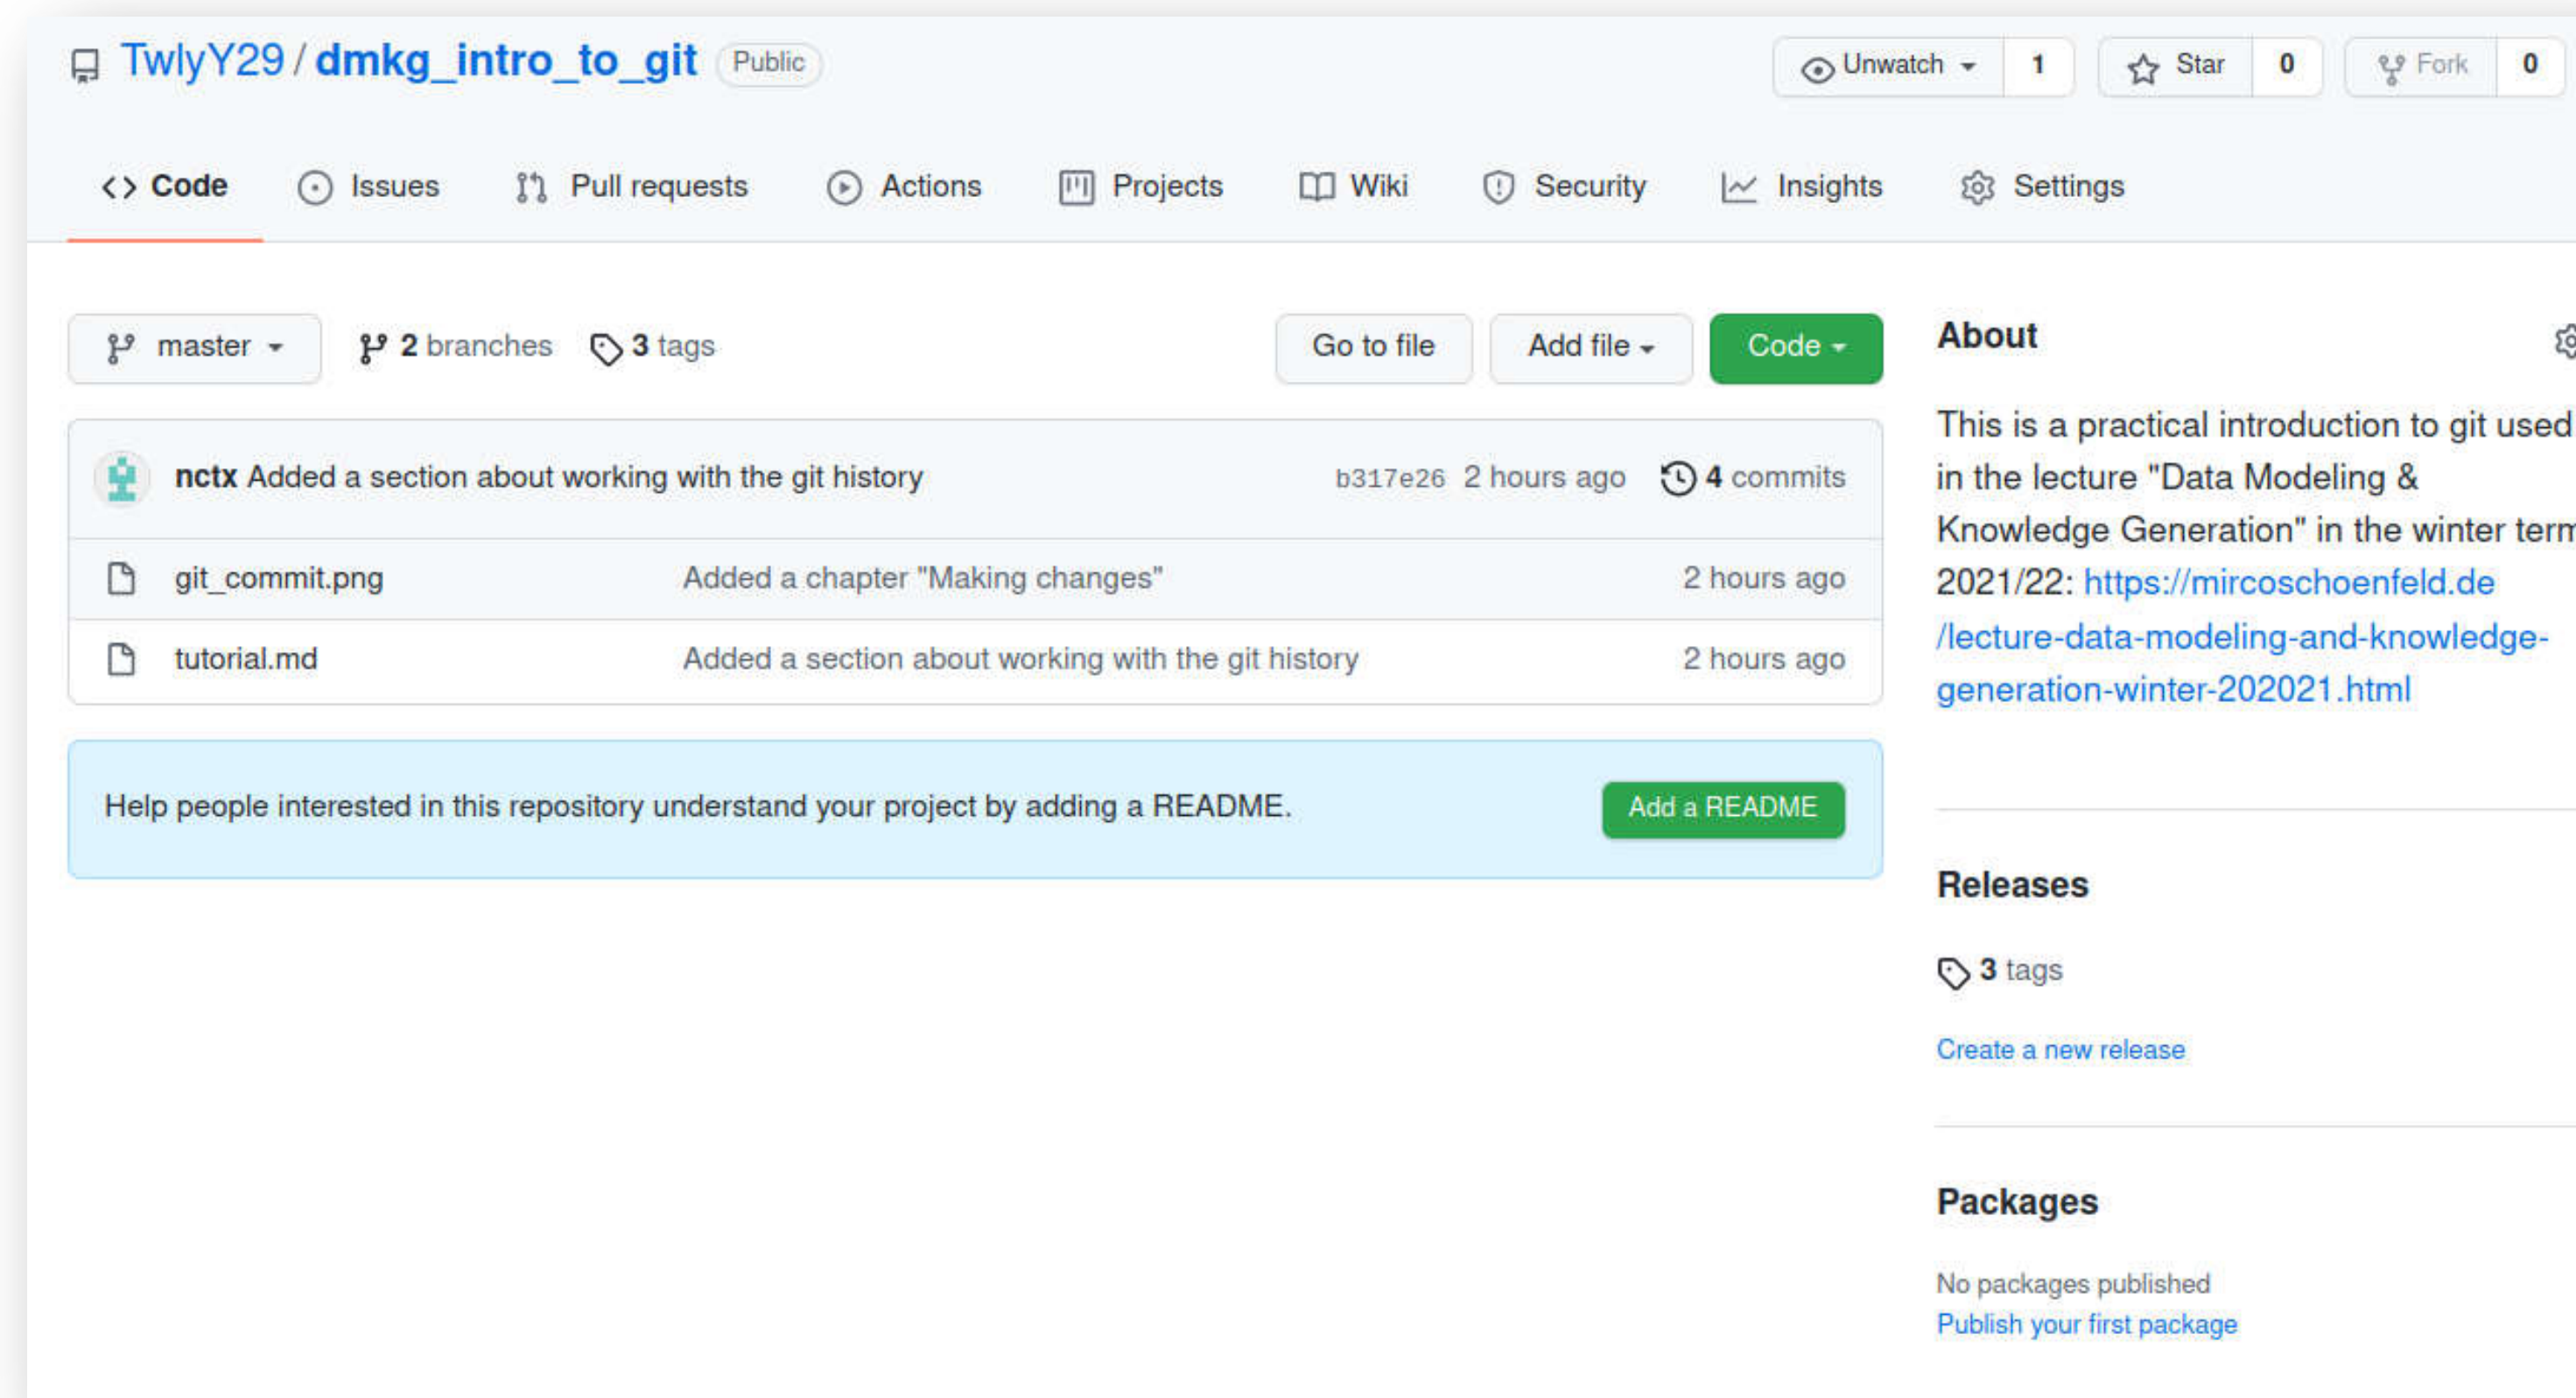

Duplication of an object under version control. Objects can then be modified separately and in parallel so that they become different. These objects are called branches.

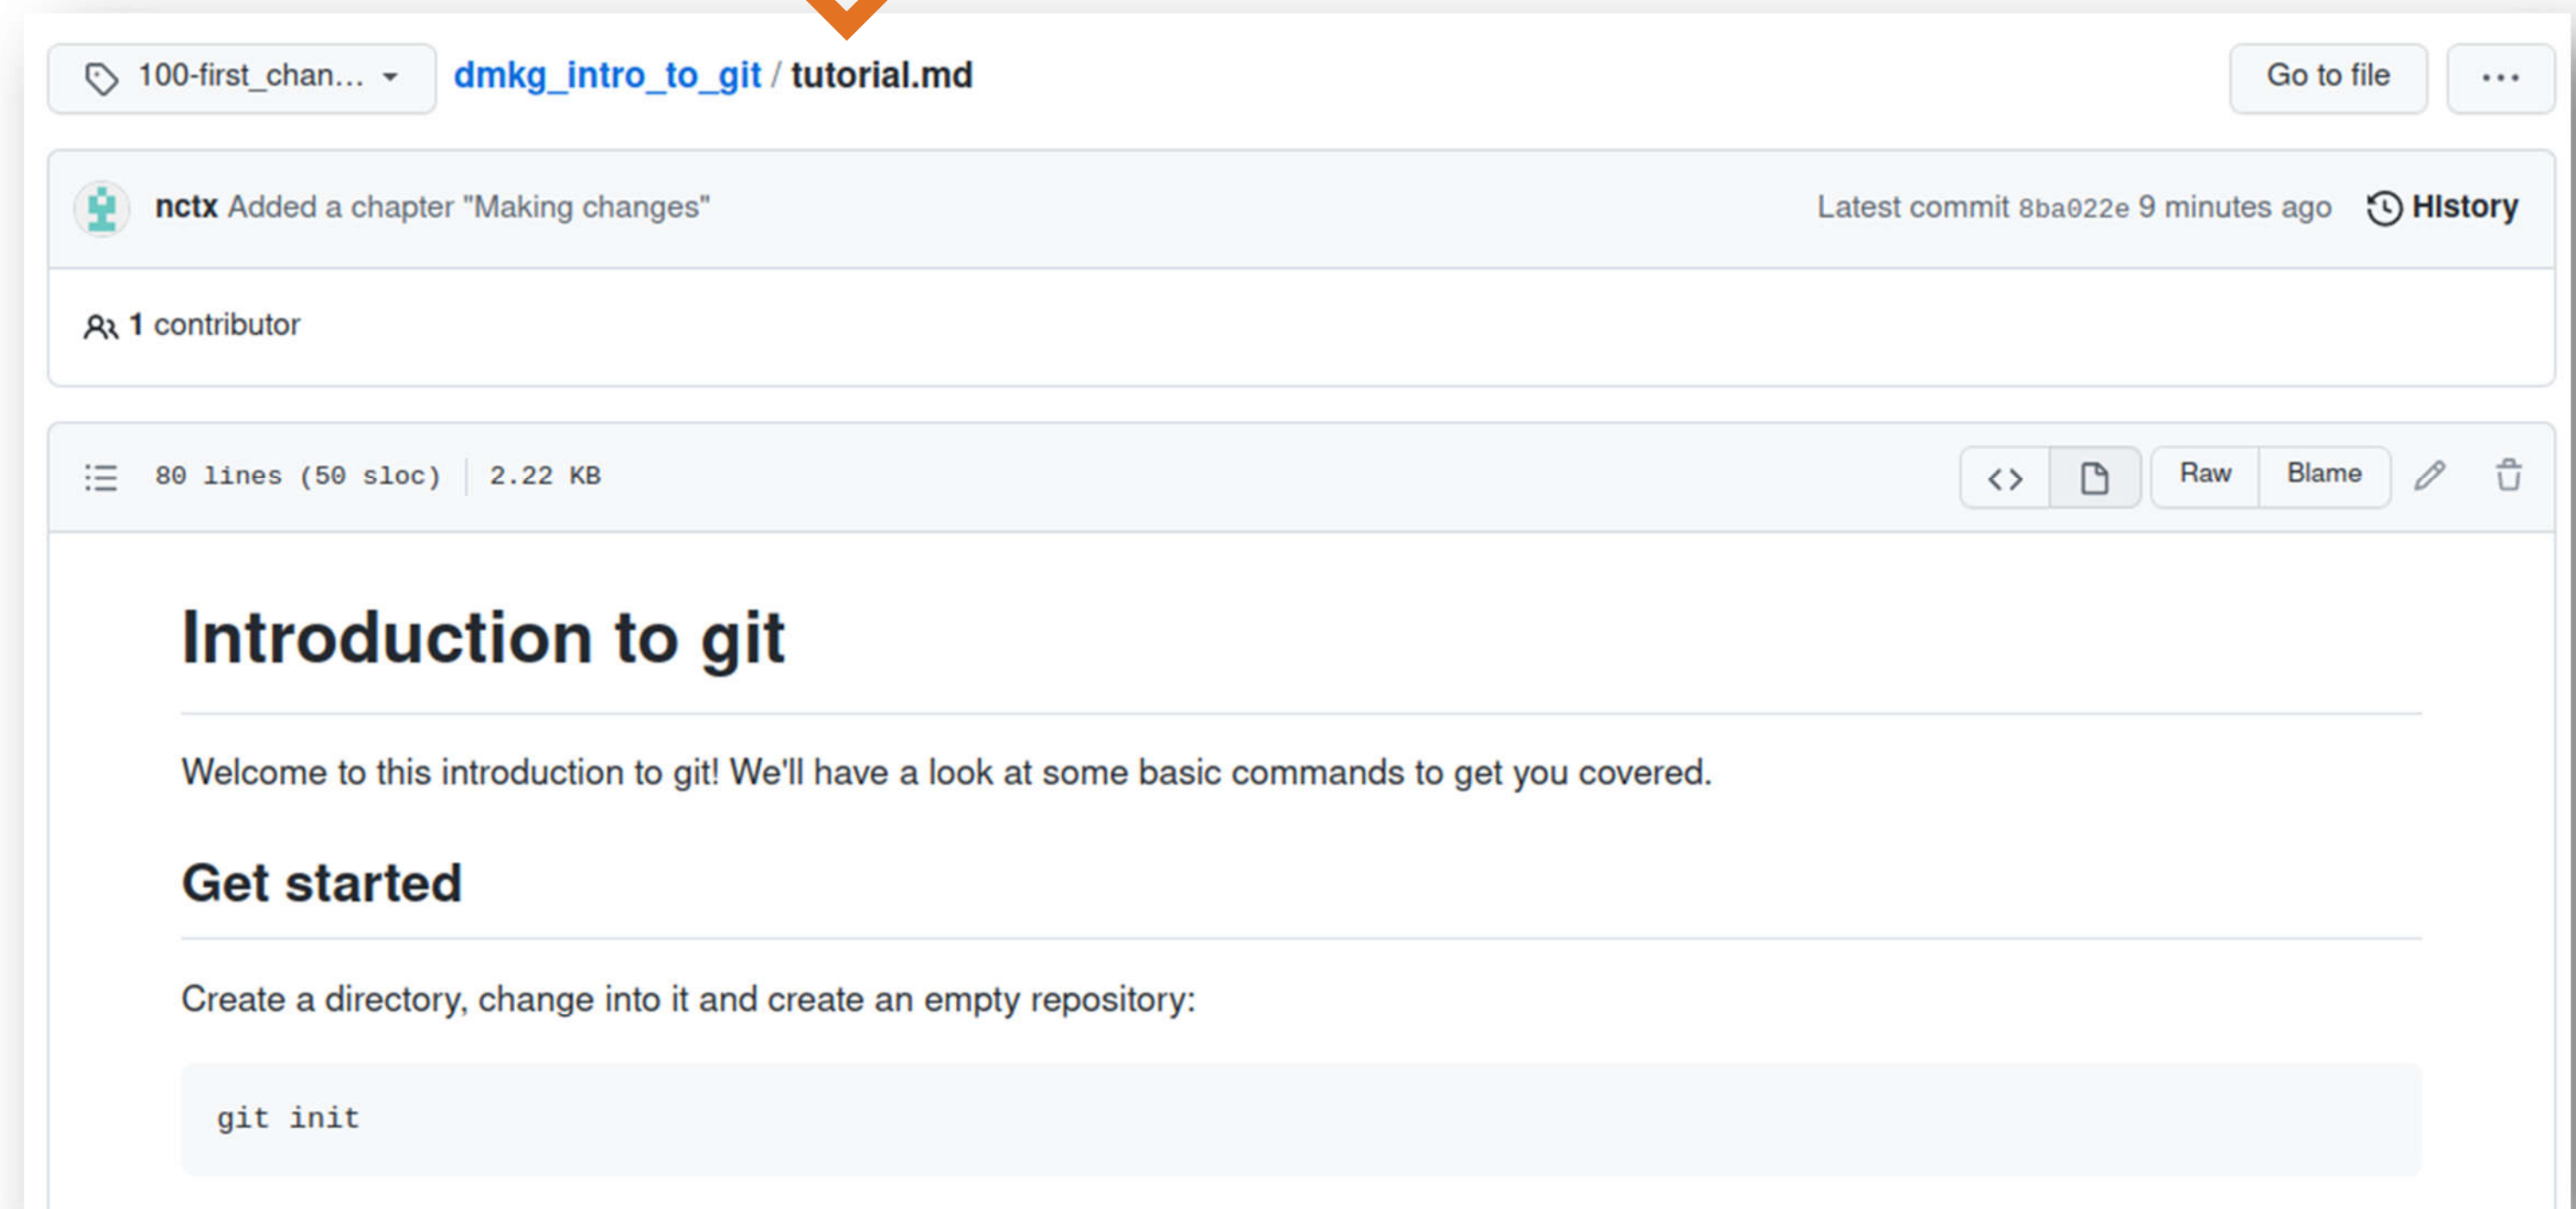

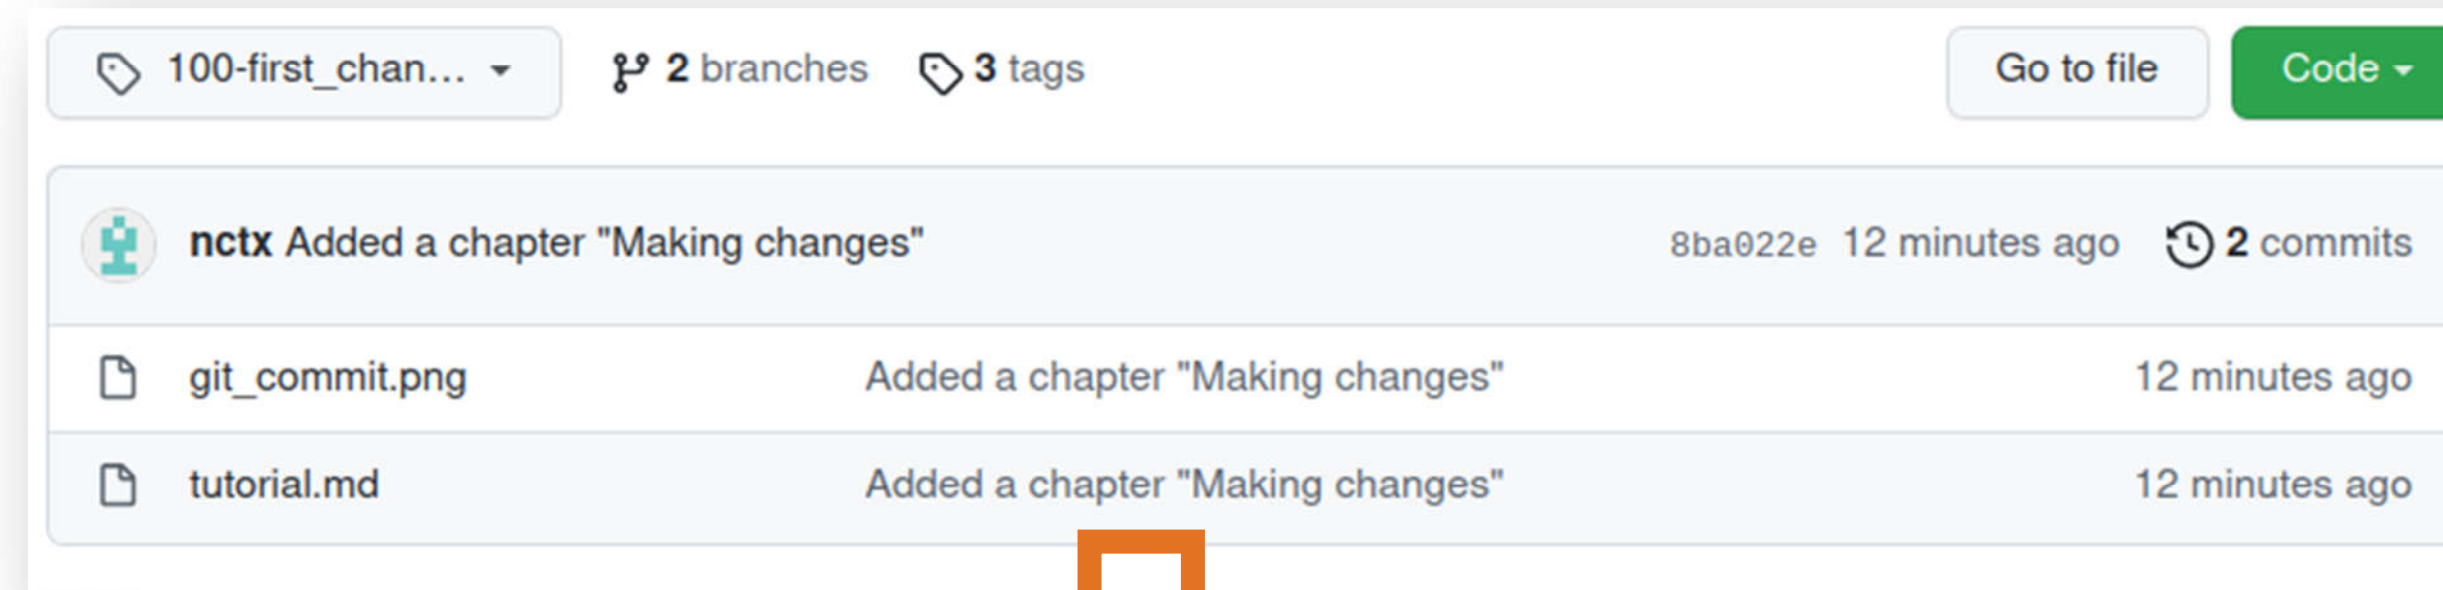

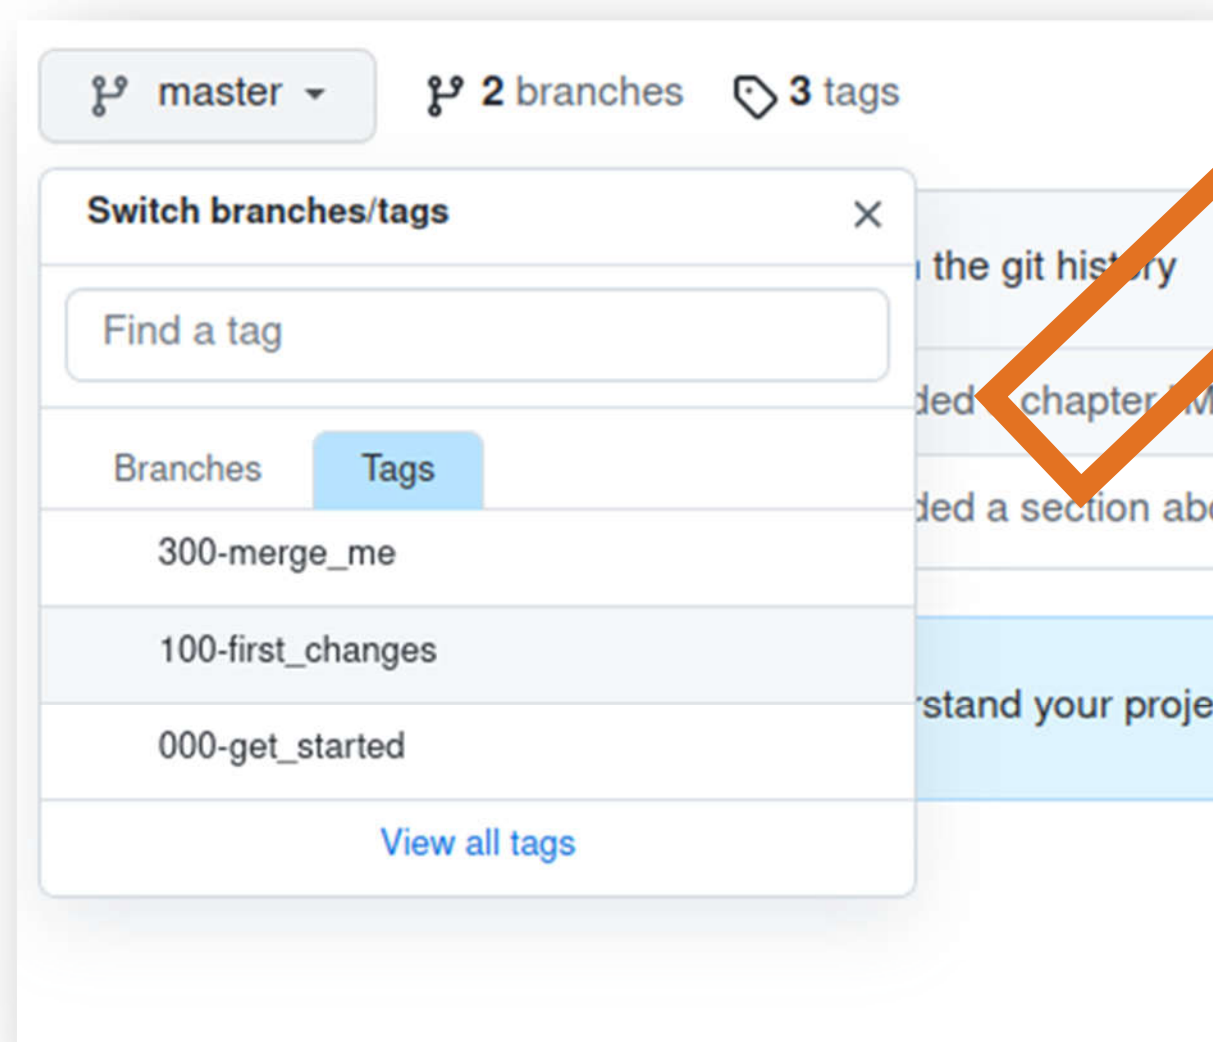

Merge

A fundamental operation that reconciles multiple changes made to a version-controlled collection of files. Necessary when files are modified on two independent branches. The result is a single collection of files that contains both sets of changes.

Let's check (g)it out!

File Edit View Search Terminal Help
mirco@breadbox:~/dmkg_intro_to_git$ git checkout 000-get_started
Note: switching to '000-get_started'.

You are in 'detached HEAD' state. You can look around, make experimental
changes and commit them, and you can discard any commits you make in this
state without impacting any branches by switching back to a branch.

If you want to create a new branch to retain commits you create, you may
do so (now or later) by using -c with the switch command. Example:

    git switch -c <new-branch-name>

Or undo this operation with:

    git switch -

Turn off this advice by setting config variable advice.detachedHead to false

HEAD is now at 2c4ca58 initial commit
mirco@breadbox:~/dmkg_intro_to_git$ ls
